CSCE 883 midterm preparation

Prepared from the professor's revised Homework 1–3, lecture decks 1–9, and your description of the exam and classroom examples. Lecture 10 is excluded. These are study materials and an original practice exam, not predictions of the actual questions.

- Study guide: prioritized checklist, homework map, formulas, derivations, and code-reading strategies.
- Practice midterm: 100 points, suggested 120 minutes, no code writing, with a required hand convolution and a short diffusion-loss interpretation.
- Worked answer key: open after attempting the exam; includes reasoning and partial-credit guidance.

Use your permitted one-page, single-sided cheatsheet while practicing. The guide ends with suggestions for what to put on it. The practice duration is a suggested study format; the actual exam duration was not provided.

`sources/` contains extracted slide/homework text and three images of Homework 2 pages used to recover embedded formulas and its dataset. These are reference extracts, not complete replacements for the original decks: diagrams and some equations do not survive text extraction. Original source locations and useful slide/page references are listed in the guide. Both Lecture 6 files were inspected; they substantially overlap. Homework 0's startup exercise and the final-project files are peripheral to the stated exam and are not used as the practice exam's basis.
